

A**B****C****D**

● Model 1 ▲ Model 2 ● Men ● Women

Supplementary figure 1: Sex-stratified associations between clusters and standardized VAT (A), SAT (B), VAT/SAT ratio (C) and body fat percentage (D). VAT, SAT and VAT/SAT ratio were log-transformed and standardized before regression analyses and body fat percentage was standardized on the original scale. Estimates are shown relative to Cluster 2. Model 1 is adjusted for age and Model 2 is further adjusted for smoking status and physical activity. Dots and triangles represent point estimates and horizontal lines 95% confidence intervals. No statistically significant ($p > 0.05$) sex-by-cluster interactions were observed.
